

The tokenizing, stemming and phrase matching is a traditional Natural Language Processing method. No exact word matching and distance based word matching can match all symptoms. Therefore, in this case, this form of NLP is inefficient.

A more efficient Natural Language Processing method would be integrating the Large Language Model (LLM) into the system.

The only step in the pipeline that the LLM will be taking over is to match the user reported symptoms with the dummy symptoms.

The framework of the Large Language Model is:
